**To:** Battaglia, Frank  
**Cc:** Tisa, Kimberly  
**Subject:** a couple of items for the checklist

### BASF CMI:

1. As discussed in emails, the proposed future use was as open space or parking. There are at least references in the March 22, 2018 CMI, as revised, that refers to "Recreational Facility for Public Use". See pp. 8 (under ELUR) and pp 33 (Section 4.2.3).
2. As mentioned yesterday, I need to confirm how/when Dexil will be used. I don't think they have the data to support segregation and I thought it was specifically to be used for verification sampling. I still need to refer back to emails for the correction factor since it still appears to indicate a CR of 1.25 in Attachment 3.
3. Page 31. Section 4.2.1.9. This section refers to use of "excess grading material" for backfill. Do you know what this is? PCB-contaminated materials should not be "graded", so I'm not clear what this refers to.
4. Page 34, Section 4.2.4.1. The 2<sup>nd</sup> to last sentence indicates that samples for VOCs and PCBs will be collected {after addition of the chemical oxidant}. For PCBs, following excavation, sampling must be conducted to confirm PCBs are < 25 prior to addition of CO. They may have erred here and meant only this sampling to apply only to the VOCs, but I'm not sure.

We can talk when you have a chance.
